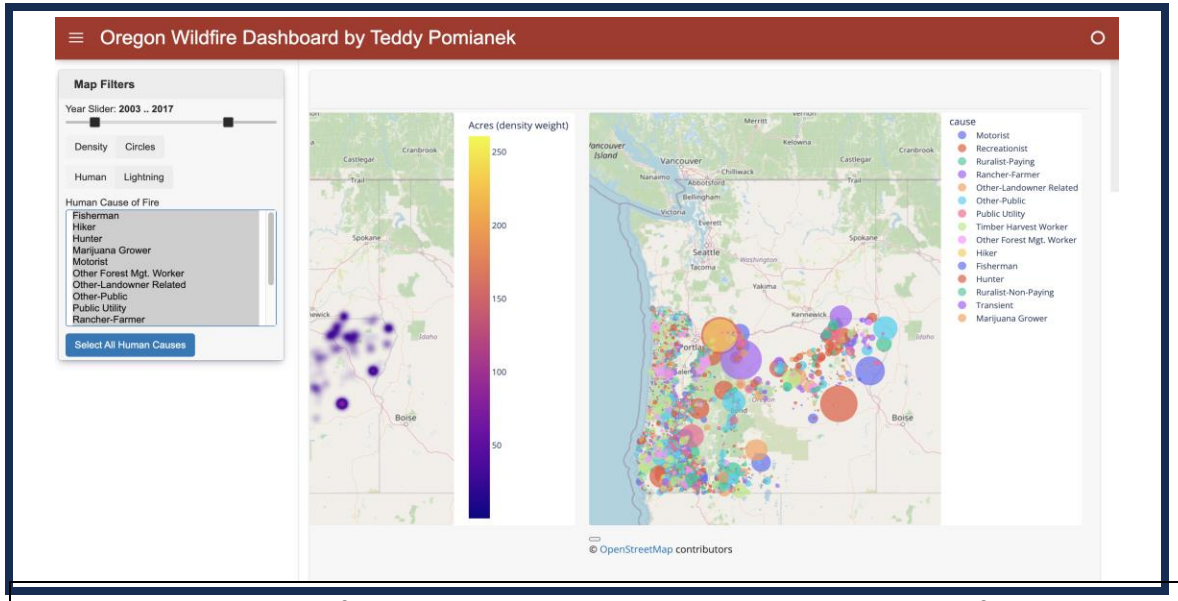

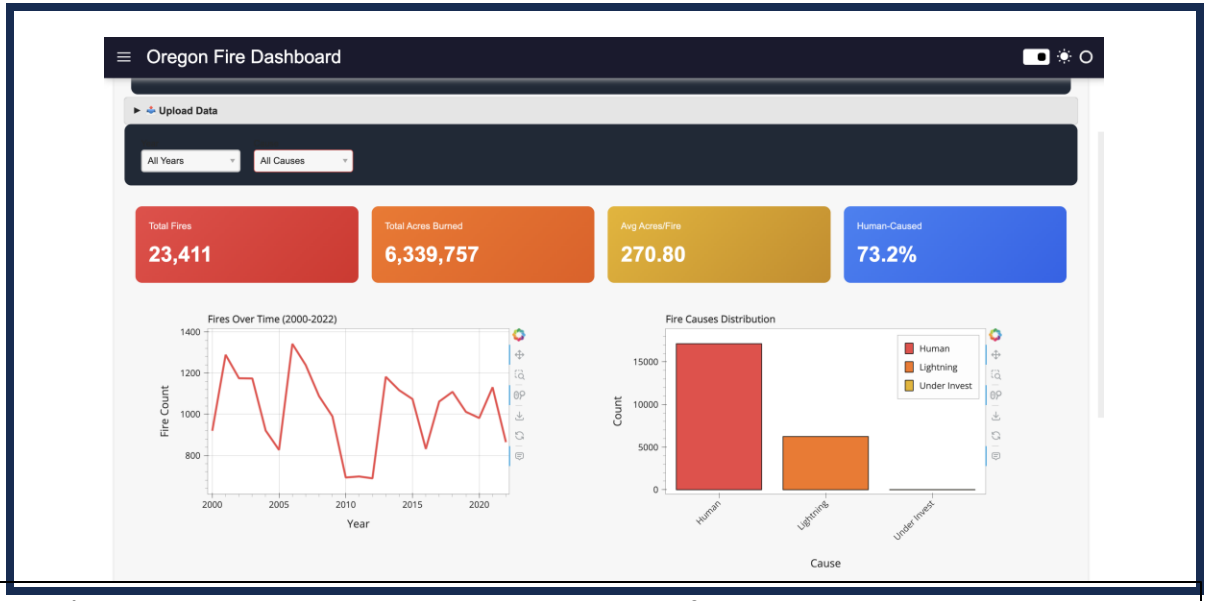

Mapping Oregon Wildfire Data

Teddy Pomianek

The data I used came from a website containing a large collection of the U.S. government's open data: Data.gov. The data contains information about the precise location, causation, and size of different wildfires that occurred in Oregon from 2000 – 2022. The figure on the right depicts the dashboard created entirely by Claude AI. Using Claude to create a dashboard proved difficult as the first five or six queries ended in errors and overall headaches. Ultimately, I had to ask it to generate me a python file using HoloViz Panel so I could get a functional and readable product. However difficult it was to get a polished dashboard, Claude's dashboard was accurate and useful. As for my Dashboard, I wanted to take advantage of the "CauseBy" column of my dataset which contains different human causes for wildfires. In my search through the Plotly library for potential ideas, I found both the density map and the scatterplot map. Both options I thought would give a useful visual that connects how a fire starts to its size and location. My panel features a year range slider, a toggle between a density map (Hotter colors correspond to areas with larger and more closely packed wildfires. Cooler colors to areas with smaller/less tightly packed wildfires) and a scatterplot map (larger circles connect to larger fires and vice versa), a human vs lightning toggle, and a multiselect table to look at individual human fire causes. Using this panel, it is easy to make insights such as what locations of the state have the largest forest fires? What are the primary human causes of wildfires in Oregon? What trends can we see about how wildfires start through the years? Overall, Claude did a good job and I'm sure if I asked it more questions to customize the dashboard that it could make a similar if not better product than myself. Ai proves to be a useful tool for data analytics but does not replace a human's ability to creatively come up with ideas for visualizations or other ways to use data.
